                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences AAY69576-Y69586 and AAY69598-Y69599 represent peptides that may Co be used to induce anti-IgE (immunoglobulin E) autoantibodies in a dog. CI IgE is an important mediator of canine allergic responses, including Type CI Immediate hypersensitivity. It is estimated that up to 30% of all dogs common canine allergies or allergy-related skin disorders, and allergic content of the most frequent. Once IgE has been released in response to being the most frequent. Once IgE has been released in response to CI allergen, the IgE binds to receptors on mast cells. The IgE molecules CI can then become cross-linked, which induces the mast cells to release CI histamine, which leads to the manifestation of allergic or conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variation corresponde to appropriation of allergic response even in the absence of allergen. Anti-IgE autoantibody induction results in a immune creative variation of allergic are the tracest and accessing B cell which would exaces the IgE production by B cells and/or targetting conservation. The peptides 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel binding protein which specifically binds to native canine free or B-cell bound IgE, and which doesn't bind to IgE when the IgE is bound to mast cells. THe peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

ANY50876-Y50900 represent peptide mimotopes used in the method of the
                                                                                                                                                   AAW24098-106 are peptide fragments containing at least 5 continuous amino acids of the partial canine immunoglobulin E (IgE) protein shown in AAW24097. The peptides are used for the preparation of anti-canine IgE antibody. The anti-canine IgE antibody can be used for the diagnosis of canine allergies.
                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antigenic peptides (1) (1) have anti-allergic, anti-anaphylactic CC and anti-asthmatic properties. (1) induces polyclonal antibodies compenies for a target effector site on the epsilon-heavy chain of IgE, CC and so preventing triggering and activation of mast cells and basophils CC and downregulation of IgE synthesis. Conjugates, or fusion peptides, CC containing (1) are used for active immunisation against IgE-mediated CC containing (1) are used for active immunisation against IgE-mediated CC allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy CC dermatitis. Nucleic acids that encode these compounds are useful for CC conjugates of (1) that include a promiscous The lager cell epitope (1) that include a promiscous The lager cell epitope (functional in genetically diverse subjects), in addition to a B cell CC constraints (disalifide bridge) to stabilise conformational features and CC maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAV79994 to AAV80084 represent amino CC acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 100

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant region 3 from the dog. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema.

The canine IgE amino acid sequence (AAR97753) was deduced from an isolated gene (AAT29824) obtd. from a canine liver DNA library. The cloning of the IgE gene allows prodn. of large quantities of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide is encoded by exons 1-4 (see AAT79278) of canine IgE heavy chain constant region (epsilon) genomic DNA. Another polypeptide, comprising the exon 5 and 6 product, is given in AAW23068. Recombinant peptides encoded by exons 1-6 can be produced in eukaryotic or prokaryotic cells. Such peptides, and antibodies raised against them, are used in methods to treat the manifestation of allergy in dogs, e.g. to treatment Type I immediate hypersensitivity, and for immunomodulation.

dogs suffer from allergies or allergy-related skin disorders, and allergic dermatitis is thought to affect between 3 and 15% of dogs. Common canine allergens include fleas, pollens, moulds and dust, with flea allergy being the most frequent. Once IgE has been released in response to allergen, the IgE binds to receptors on mast cells. The IgE molecules can then become cross-linked, which induces the mast cells to release histamine, which leads to the manifestation of allergic symptoms. The peptides of the invention correspond to epitopes of canine IgE, or conservative variations thereof, that are accessible in circulating IgE but not in IgE bound to mast cells. The autoantibodies produced on immunisation with such peptides therefore target only circulating IgE, avoiding the possibility that they may cross-link bound IgE molecules, which would exacerbate an ongoing allergic response even in the absence of allergen. Anti-IgE autoantibody induction results in an immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    recombinant IgE using bacterial, yeast, mammalian, insect or viral systems. The IgE can be used in drug development (e.g. small molecule screening, assay development and anti-IgE antibody generation). Fragments of IgE can be used in vaccines or to prevent IgE-mediated hypersensitivity. The new sequence information permits targeted modulation of IgE-mediated immune

                                                                                         This invention describes a novel binding protein which specifically binds to native canine free or B-cell bound IgE, and which doesn't bind to IgE when the IgE is bound to mast cells. THe peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      response that targets the IgE-expressing B cell, which affects IgE synthesis by downregulating IgE production by B cells and/or targetting the IgE-producing B cell for destruction. The peptides of the invention are therefore useful for the treatment or prophylaxis of allergic symptoms in a dog. Sequences AAY69587-Y69588 represent peptides used in exemplifications of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Canine; allergy; antibody 8H.8; epitope; prophylaxis; treatment;

RESULT :
                                                                    The invention relates to peptides (AAY69576-Y69586, AAY69598-Y69599) that CC may be used to induce anti-IgE (immunoglobulin E) autcoantibodies in a CC dog. IgE is an important mediator of canine allergic responses, including Type I immediate hypersensitivity. It is estimated that up to 30% of all CC dogs suffer from allergies or allergy related skin disorders, and callergy ted dermetitls is thought to affect between 3 and 15% of dogs. CC Common canine allergens include fleas, pollens, moulds and dust, with CC flea allergy being the most frequent. Once IgE has been released in CC response to allergen, the IgE binds to receptors on mast cells. The IgE molecules can then become cross-linked, which induces the mast cells to CC release histemine, which leads to the manifestation of allergic symptoms. CC The peptides of the invention correspond to epitopes of canine IgE, or CC conservative variations thereof, that are accessible in circulating IgE but not in IgE bound to mast cells. The autoantibodies produced on immunisation with such peptides therefore target only circulating IgE, CC avoiding the possibility that they may cross-link bound IgE molecules. CC which would exacerbate an ongoing allergic response even in the absence of allergen. Anti-IgE autoantibody induction results in an immune cresponse that targets the IgE-expressing B cell, which affects IgE synthesis by downregulating IgE production by B cells and/or targetting CC synthesis by downregulating IgE production. The peptides of the invention CC are therefore useful for the treatment or prophylaxis of allergic compared with peptide AAY69584 in binding studies with the anti-canine CC Invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     B

The sequence is that of the vaccinia virus B18R protein which is involved in the binding of interleukin (II)-2 and/or II-6 which is involved them from reaching their natural receptors, hence the inflammatory response is diminished and viral replication is enhanced. Its gene sequence may be inactivated or all or part of it deleted to allow greater attenuation of the virus, enhanced immunogenicity of the recombinant vaccinia virus and/or provide sites for the insertion of heterologous genes. This recombinant vaccinia virus may be used as a live vaccine in both human and veterinary medicine. See also AAR24250 and AAR24252.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New vaccinia vector genes and expression products - useful in diagnosis and treatment of inflammatory conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polyvalent vaccine; interleukin binding; IL-2; IL-6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DЬ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            20
                      CC The present sequence represents rat antigen Ag2117. The antigen is CC representative of pancreatic cell lines. The antibody that recognises CC Ag2117 was identified using the method of the invention. The Specification describes a method for immunizing a host mammal to produce CC appulation of monoclonal antibodies that bind to antigens CC representative of a specific cell type that are heterologous to the CC and viable cells with surfaces which are free of serum. The methods CC are useful for producing populations of antibodies that bind to antigens CC are useful for producing populations of antibodies that bind to antigens CC are tissue-selective, sub-tissue selective or cell-type specific. These CC antibodies facilitate the identification of novel antigens and the CC are the antibodies or hybridomas produced using the methods have CC delineation of the combination of surface antigens on a specific cells CC type. The antibodies or hybridomas produced using the methods have CC diagnostic and therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       II-1-beta mediated conditions. The sequence can also be used as part of a kit to detect and mesure II-1B. The sequence (AAQ46244) encodes similar protein and recombinant vvs in which expression of B15R and B18R is inactivated. To introduce restriction sites close to the initiator methionine of B15R, a PCR copy of the 5' region of the ORF was constructed using primers (AAQ46241-42).
                                                                                                                                                                                                                                                                                                                  Immunizing a host mammal to produce population of monoclonal antibodies that bind to antigens of specific cell type comprises introducing viable cells with serum-free surfaces -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              29-JUN-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rattus

The present invention describes immunogenic portions of lung tumour-
CC associated proteins (I) and the nucleic acids (NAs) that encode them.
CC (I) have cytostatic activity and can be used in gene therapy, antisense
CC inhibition and in vaccines. The NAs and the lung tumour associated
CC inhibition and in vaccines. The NAs and the lung tumour associated
CC diagnosis of diseases associated with their inappropriate expression,
CC especially lung cancers. For example, the NAs may be administered to
CC treat diseases by rectifying mutations or deletions in a patient's genome
CC treat diseases by rectifying mutations or deletions in a patient's genome
CC treat diseases by rectifying mutations or deletions in a patient's genome
CC to supplement the patients own production of (I). Additionally, the
CC NAS may be used to produce the lung-tumour associated protein according
CC to standard recombinant DNA methodology. Conversely, antisense NA
CC molecules may be administered to down regulate protein expression by
CC binding with the cells own genes and preventing their expression. The NA
CC and complementary sequences may also be used as DNA probes in diagnostic
CC assays to detect and quantitate the presence of similar NA sequences in
CC cancer. The (I) may be used as antigens in the production of antibodies
CC and. in assays to identify modulators (agonists and antagonists) of the
CC expression and activity of the protein. AAF68083 to AAF68078 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Its amino acid sequence was deduced from cDNA clones (AAT46075) obtd. from HL60 and T-cell lines. ALCAM polypeptides can be produced, e.g. as a fusion proteins, in transformed host cells. They are useful for inhibiting CD6/CD6 interactions between cells and to screen for agents that modulate this interaction. Inhibitors can be used to treat e.g. inflammation, multiple sclerosis, inflammatory uveitis, rheumatoid arthritis, T-cell mediated vasculitis syndromes, organ allograft rejection and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CD6 ligands present on surface of thymic epithelial cells - used develop prods. for treating e.g. inflammation, organ allograft rejection or neuro:degenerative diseases

They are the respective products of nucleic acid sequences HCASeq.1 (AAT28819) and HCASeq.2 (AAT28820) obtd. from human CD34+ bone marrow. Expression systems are provided for production of recombinant HCA proteins. The proteins are useful as stem cell marker proteins in functional studies, and can also be used to produce antibodies that allow the purification of stem cells from haematopoietic and other sources.

This polypeptide is a human CD6 ligand (see AAW47088), designated activated leukocyte-cell adhesion molecule (ALCAM), that is present on the surface of thymic epithelial cells, monocytes, activated T cells and a variety of other cells. Its amino acid sequence was deduced from cDNA clones (see AAV1354) isolated from human T cell and HL60 cDNA libraries. It is the human homologue of chicken BEN, and shows homology to neurolin, RACE and WC18. Anti-CD6 ligand antibodies, or their binding fragments, are useful for inhibiting binding of CD6 present on the surface of a first cell to that present on a second cell. CD6 ligands and anti-CD6 ligand antibodies are also useful in screening test compounds for the ability to inhibit binding of CD6 ligand to an anti-CD6 ligand antibody to inhibit binding of CD6 ligand to an anti-CD6 ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note- "N-glycosylated"

                                                                                                                                                                                                                                                        The invention relates to peptides (AAY69576-Y69586, AAY69598-Y69599) that CC may be used to induce anti-IgE (immunoglobulin E) autoantibodies in a Go dog. IgE is an important mediator of canine allergic responses, including CC Type I immediate hypersensitivity. It is estimated that up to 30% of all GO dogs suffer from allergies or allergy related skin disorders, and callergic dermatitis is thought to affect between 3 and 15% of dogs. CC common cenine allergens include fleas, pollers, moulds and dust, with CC flea allergy being the most frequent. Once IgE has been released in response to allergen, the IgE binds to receptors on mast cells. The IgE composes to allergen, the IgE binds to receptors on mast cells. The IgE composes to allergen, the IgE binds to receptors on mast cells. The IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE could be produced on mast cells. The autoantibodies produced on a circulating IgE could be IgE conservative variations thereof, that are accessible in circulating IgE could be produced on mast cells. The autoantibodies produced on the invention starget only circulating IgE could be IgE conservative variations thereof, that are accessible in circulating IgE could be IgE conservative variations thereof, that are accessible in the absence conservative variations thereof, that are accessible in the absence in the bessible to a seven in the absence conservative variation peptides therefore target only circulating IgE could be IgE conservation of allergic response that targets the IgE-captessing B cell, which affects IgE conservations be cell for destruction. The peptides of the invention composed with peptide and conservation between an anti-canine of invention of the present in an immune in a dog. Sequences and Sequences and Sequences with the anti-c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel binding protein which specifically binds to native canine free or B-cell bound IgE, and which doesn't bind to IgE when the IgE is bound to mast cells. The peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

AAY50876-Y50900 represent peptide mimotopes used in the method of the inventor.

It was used to construct a number of immunogenic peptides which consisted of regions of IgE from different mammals, which appear to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such

The antibodies are used in diagnostics that require human antibodies instead of animal antibodies, such as determine the Rh phenotype of human red blood cells. AAH68615 to AAH68726 represent the nucleotide sequence which encode AAG93558 to AAG93669. AAG93670 to AAG93697 represent anti-Rh(D) heavy chain CDR3 amino acid sequences which are given in the exemplification of the present invention.
This polypeptide comprises the intermediate-type immunoglobulin like domain (IgI of bovine butyrophilin (BTN, see AAW97812), a major
                                                                         New modified butyrophilin - not cross-reactive with myelin oligo-dendrocyte glycoprotein, useful in dairy products, vaccines, and assays for susceptibility to multiple sclerosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC component of the milk fat globule membrane and member of the communoglobulin (Ig) superfamily. The IgI domain of BTN has a high code degree of identity with the IgY domain of myelin/ofigodendrocyte glycoprotein (MOG, see AAM97817). Immunisation with exogenous BTN crimines the production of antibodies which cross-react with condition is directed to methods of modifying the BTN protein to eliminate sequences that elicit this immune response to MOG, e.g. climinate sequences that elicit this immune response to MOG, e.g. climinate sequences that elicit this immune response to MOG, e.g. climinate sequences that elicit this immune response to MOG, e.g. composed of an exophasmic domain of a non-human BTN (nbFN) (preferably bovine) producing a humanised chimeric BTN composed of an exophasmic domain comprising a human IgI domain and compositing a nibrN (preferably bovine) B30,2 region. The hypertion compositing a nibrN (preferably bovine) B30,2 region. The hypertion compositing a nibrN (preferably bovine) B30,2 region. The hypertion compositing a nibrN (preferably bovine) B30,2 region. The hypertion compositing a nibrN (preferably bovine) B30,2 region. The hypertion compositing a nibrN (preferably bovine) B30,2 region. The hypertion compositing a nibrN (preferably bovine) B30,2 region. The hypertion composition of the endogenous BTN gene of an induct BTN is milk. Dairy products including modified into the composition of the nibrN (preferably bovine) B30,2 region. The hypertion of a human patient at risk of developing a product of the patient from injecting bovine BTN is also possible, by screening the patient from injecting bovine BTN is also cossible, by screening the patient from high and constructs based on nucleic acids encoding naTN, are used as vaccines to induce immunological tolerance to nhBTN in humans (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Loc

07-JUN-1995;
A novel soluble fused major histocompatibility complex (MHC) heterodimer:peptide complex, comprises DNA encoding 1st and 2nd MHC domains, e.g. the present sequence, linked by DNA encoding a 5-25 residue linker, and a DNA encoding an antigenic peptide able
                                                                                                                                                                                                       Novel fused major histocompatibility complex:antigenic peptide complex - useful to induce tolerance to an autoantigen-related disease e.g. insulin-dependent diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Soluble; fusion; major histocompatibility complex; MHC; region; heterodimer; complex; alpha2; antigen; binding groove; tolerance; autoantigen; disease; insulin dependent; diabetes mellitus; IDDM; antagonist; T cell; anergy; presenting cell; NOD mouse;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and any

The complex can be used to induce immunological tolerance in adults susceptible to, or suffering from an autoantigen related disease, e.g. insulin dependent diabetes mellitus (DDM), by antagonising the binding of particular T cells and antigen presenting cells, to induce anergy (immunological non-responsiveness) in the targeted T cell. As the heterodimers and corresponding antigen are permanently linked into a single chain, obviating the requirement for complex heterodimer truncation or

Sequences AAY69576-Y69586 and AAY69598-Y69599 represent peptides that may CC be used to induce anti-IgE (immunoplobulin E) autoantibodies in a dog. CQ IgE is an important mediator of canine allergic responses, including Type CC suffer from allergies or allergy-related skin disorders, and allergic constitutivity. It is estimated that up to 30% of all dogs CC suffer from allergies or allergy-related skin disorders, and allergic CC dermatitis is thought to affect between 3 and 15% of dogs. Common canine CC allergens include fleas, pollens, moulds and dust, with flea allergy CC being the most frequent. Once IgE has been released in response to design the most frequent. Once IgE has been released in response to CC allergen, the IgE binds to receptors on mast cells. The IgE molecules CC can then become cross-linked, which induces the mast cells. The IgE molecules CC expending the variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE conservative variations thereof, that are accessible in circulating IgE avoiding the possibility that they may cross-link bound IgE molecules, CC which mould exacerbate an ongoing allergic response even in the absence CC immunisation with such peptides therefore target only circulating IgE, CC avoiding the possibility that they may cross-link bound IgE molecules, CC which would exacerbate an ongoing allergic response even in the absence CC response that targets the IgE-expressing B cell, which affects IgE synthesis by downregulating IgE production by B cells and/or targetting CC the IgE-producing B cell for destruction. The peptides of the invention CC are therefore useful for the treatment or prophylaxis of allergic SX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     . The peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

ANY50876-Y50900 represent peptide mimotopes used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fruit fly; G protein coupled receptor; DmgPCR6AL/DL;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequences AAY69576-Y69586 and AAY69598-Y69599 represent peptides that may CC be used to induce anti-igE (immunoglobulin E) autoantibodies in a dog. CC IgE is an important mediator of conline allergic responses, including Type CC I immediate hypersensitivity. It is estimated that up to 30% of all dogs CC suffer from allergies or allergy-related skin disorders, and allergic CC dermatitis is thought to affect between 3 and 15% of dogs. Common canine CC allergens include fleas, pollens, moulds and dust, with flea allergy CC being the most frequent once IgE has been released in response to CC allergen, the IgE binds to receptors on mast cells The IgE molecules CC can then become cross-linked, which induces the mast cells to release histamile, which leads to the manifestation of allergic Symptoms. The CC conservative variations thereof, that are accessible in circulating IgE but not in IgE bound to mast cells The autoantibodies produced on immunisation with such peptides therefore target only circulating IgE, CC avoiding the possibility that they may cross-link bound IgE molecules, CC which would exacerbate an ongoing allergic response even in the absence CC of allergen. Anti-IgE autoantibody induction results in an immune CC aresponse that targets the IgE-expressing B cell, which affects IgE CC synthesis by downregulating IgE production by B cells and/or targetting CC autoanties in a dom
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              В

The peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

ANYSOB76-Y50900 represent peptide mimotopes used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides a method for the diagnosis, prevention and CC treatment of ulcerative colitis (UC) using histone H1-like antigen, a CC porin antigen or a Bacteroides antigen as a target antigen. The novel CC method of diagnosing UC in a subject suspected of having inflammatory CC bowel disease (IBD) comprises: (1) obtaining a sample from the subject; CC (2) contacting the sample with a histone H1-like antigen, or perinuclear canti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form CC anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form CC fragment, and antibody to the histone H1-like antigen, and (3) detecting CC fragment, and antibody to the histone H1-like antigen; and (3) detecting CC the presence or absence of the complex; where the presence of the complex indicates that the subject has UC. The pANCA-reactive histone CC H1-like antigen, porin antigen and Bacteroides antigen are useful in the CC diagnosis, prevention and treatment of UC. The methods can also be used for identifying agents useful for treating UC. Sequences ANY34072-87 CC represent peptides derived from the B. caccae 100 kDa antigen (a microbial pANCA-reactive protein).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The invention provides a method for the diagnosis, prevention and treatment of ulcerative colitis (UC) using histone H1-like antigen, a porin antigen or a Bacteroides antigen as a target antigen. The novel method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBD) comprises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone H1-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, the presence of the histone H1-like antigen, or the pANCA-reactive fragment, and antibody to the histone H1-like antigen; and (3) detecting the presence or absence of the complex; where the presence of the complex indicates that the subject has UC. The pANCA-reactive histone H1-like antigen, porin antigen and Bacteroides antigen are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     method of diagnosing UC in a subject suspected of having inflammatory bowel disease (IBD) comprises: (1) obtaining a sample from the subject; (2) contacting the sample with a histone HI-like antigen, or perinuclear anti-neutrophil cytoplasmic antibody (pANCA)-reactive fragment, to form a complex of the histone HI-like antigen, or the pANCA-reactive fragment, and antibody to the histone HI-like antigen and (3) detecting the presence or absence of the complex; where the presence of the complex indicates that the subject has UC. The pANCA-reactive histone HI-like antigen, portin antigen and Bacteroides antigen are useful in the diagnosis, prevention and treatment of UC. The methods can also be used for identifying agents useful for treating UC. Sequences AXY34072-87 represent peptides derived from the B. caccae 100 kDa antigen (a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ulcerative colitis; histone; HI-like antigen; porin antigen;

A; Status: nucleic acid sequence not shown
A; Molecule type: mRNA
A; Molecule type: mRNA
A; Molecule type: mRNA
A; Mote: this corrects the sequence reported with accession number S07891
R; Seelan, R.S.; Scheuner, D.; Lomax, M.I.; Grossman, L.I.
Rucleic Acids Res. 17, 6410, 1989
A; Title: Nucleotide sequence of a CDNA for bovine cytochrome c oxidase subunit VIIa.
A; Reference number: S07891; MUID:89366688
A; Accession: S07891
                                                                                                                       R:TOriyama, K.; Hanaoka, K.; Okada, T.; Watanabe, M.
FEBS Lett. 424, 234-238, 1998
A;Title: Molecular cloning of a CDNA encoding a pollen extracellular protein as a pot
A;Tetreence number: 218017; MUID:98198560
A;Accession: T14380
A;Status: preliminary; translated from GB/EMBL/DDBJ

2.344 Million cell updates/sec
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the epitope of the human inducible nitric oxide synthase (hiNOS) without the C-terminal leucine. The primary wild type antigen is given in AAW12317. It was shown that the C-terminal leucine of the epitope is required for antibody recognition by the ability of radiolabelled peptide to be displaced by unlabeled peptide, and by the specificity of the antibody to a C-terminal leucine. Antibodies raised against the primary antigen can be used to purify hiNOS from cultured cells in a claimed method. Elevated levels of hiNOS are implicated in a wide variety of diseases, particularly inflammatory conditions such as psoriasis, uveitis, rheumatoid arthritis and many others. The antibodies can be used to detect or quantify hiNOS (by usual immunoassay or immunolocalisation techniques), also to evaluate the activity of iNOS modulators (which are potentially useful as therapeutic agents).
This sequence is an immunogenic peptide for detecting inducible nitric oxide synthase (1NOS) immunoreactivity which is used in a novel method to detect iNOS in a biological sample. The level of iNOS is related to an inflammatory response, e.g. infection mediated by bacteria, yeast or
                                                                                                                               Detection of inducible nitric oxide synthase - useful for monitoring levels over periods of time, or to diagnose disease associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                 Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inducible nitric oxide synthase; iNOS; endothelial nitric oxide synthase;
eNOS; diagnosis; detection; inflammatory response.

This sequence is a synthetic radio-iodinated peptide based on a C-terminal epitope of human inducible nitric oxide synthase (hiMOS). It was used to generate a standard curve in a competitive radioimmunoassay for hiMOS products. It was shown that the C-terminal leucine is required for antibody recognition by the ability of the radiolabelled peptide to be displaced by unlabeled peptide. The specificity of the antibody to a C-terminal leucine was also shown with use of peptides having amino acid substitutions/modifications at the C-terminus (see AAM12320-22), antibodies raised against the primary antigen can be used to purify hiMOS are implicated in a wide variety of diseases, particularly inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a virus, organ transplant rejection, rheumatoid arthritis, interstitial cystitis or cancer. By monitoring levels of iNOS over a period of time it is possible to diagnose a disease or condition associated with increased or decreased iNOS.
                                                                                                                                                                                                                                                                                       Calaycay JR, Mumford RA,
